Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300) mu g/ml per dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim

Wild type PBP is a bifunctional protein, which binds the cell membrane when expressed in a bacterial cell, having transplycosylase and transpeptidase activities. The variant protein (NCIMB 4065) in conjunction with a labelled anti-bifunctional PBP monoclonal antibody, can be used to identify and assay for cpds. which bind bifunctional PBP. Such cpds., as inhibitors of bifunctional PBP have a potential use in therapeutic cpds. which inhibit the growth of antibiotic resistant bacteria. The soluble variant may also be used in X-ray
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sol. derivs. of bifunctional penicillin binding protein opt. lack transglycosylase activity, useful to identify for antibodies or cpds. which bind BPBPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transglycosylase; transpeptidase; identi antibiotic resistant; bacteria; soluble X-ray crystallography; determination.

prokaryotic cellular proliferation, their use in identifying the prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus and Enterococcus faccalis. The preumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The preumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also used in Foreitian of protential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to expressed proteins.

The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             300

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detecting an autibiotic resistant strain of Streptococcus pneumoniae using primers based on the peniciliah binding protein 18 (pp22) gene using primers based on the peniciliah binding protein 18 (pp22) gene cand the ppplA gene. The products and methods can be used for detecting S. pneumoniae, particularly antibiotic-resistant strains. They can be used for shmultaneously diagnosing pneumococcal meningitis and identifying any antibiotic-resistant S. pneumoniae strains in a sample. The methods can be used for detecting S. pneumoniae strains resistant to antibiotics, e.g. beta-lactam antibiotics, preferably penicillin. The assays can be used to detect other pathogens causing meningitis. The assays can be used to detect on the pathogens causing meningitis. The assays can be used to detect an antibiotic resistant strain of S. pneumoniae with a minimum inhibitory concentration (MIC) of 0.25-1 micro g/ml where the PCR products detected are a 1043 bp and a 224 bp product. The present sequence represents a Streptococcus sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                            3,
                                                  The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
invention is also useful for the identification of potential new targets for antibitic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.
                                                                                                                                                                                                                                                                                                                                       201 vymangfygmetaaenyygkhlseldlpqtallagmpqapnsydpytkpdtakerrdvvl 260

```
sequence can be inserted into an expression vector (preferrably a bacterial expression vector) to provide for high levels of expression of the protein. The protein can then be used in the production of an acellular vaccine. These vaccines are used to provide protection from Gram positive bacterial infection. Antibodies against export proteins
                                                This sequence represents exp2. The DNA encoding this sequence is identical to that for ponA which encodes penicallin-binding protein IA (PBPIA). This sequence is involved in adhesion of bacteria to target cells. This sequence is an exported protein of S.pneumoniae. Export proteins are the proteins in pathogenic bacteria that are virulence determinants. Other export proteins include plpA (see AAR70152), exp3, and pad1 (encoded by the sequence shown in AA083259). This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomona aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAU03601-AAU03722 represent Group B Streptococcus (Streptococcus agalactiae) amino acid sequences of the invention. S. agalactiae is an encapsulated bacterium which is a major pathogen of humans causing sepsis and maningitis in neonates as well as adults. The S. agalactiae antigenic polypeptides are used to vaccinate against Group B Streptococcus infections, particularly to prevent infection in new born children arising from the maternal genital tract. An immunogenic composition is useful in the preparation of a medicament for the treatment or prophylaxis of Group B Streptococcus infection. The invention does not have the disadvantages of varied response rate associated with prior art capsid polysaccharide vaccination against Group B Streptococcus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     62 QSNSLQGGSTLTQQLIKLTYFSTSTSDQTISRKAQEAWLAIQLEQKATKQEILTYYINKV 121

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aucues, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organism. The present sequence represents an essential prokaryotic cellular proliferation protein.

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ55473 represent pCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            235

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polypucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                 Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Scarselli M;

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ54431 represent polyneptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55431 represent polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55431 represent polypeptides. The polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing in the neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                            Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is the Streptococcus pneumoniae penicillin-binding protein, designated PBP-NV, of the invention. The protein is useful in screening assays for compounds that bind to PBP-NV or inhibit the . transglycolase or trans-peptidation activity of PBP-NV. Such compounds would be useful as antibacterial agents for treating S. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 --- MAAAYAAFANGGT 442

This sequence is a H. pylori cell envelope inner membrane protein

involved in outer membrane and cell wall synthesis. The protein may be

used in a vaccine to prevent or treat, pylori infection or to identify

H. pylori polypeptide binding compounds, useful as potential H. pylori

Ilfe cycle activators or inhibitors. The DNA and probes derived from it

may be used for the identification of H. pylori in a sample and the

diagnosis of H. pylori infection. Nucleic acid sequences complementary

to the DNA act as antisense sequences and can be used to prevent the

translation of H. pylori mRNA. Antibodies against the protein can be

used in immunoassays to evaluate the abundance and distribution of

H. pylori-specific antigens. The genomic sequence of H. pylori

(ATC 55679) as determined from overlapping contigs generated by

mechanically shearing the bacterial DNA. The sequences were analysed

for ORF of at least 180 nucleotides, and the predicted coding regions

for ORF of at least 180 nucleotides, and the predicted from various ORF

were analysed for significant homology to other known or exported

methanicallar regions can be isolated from H. pylori by PCR

interest, particular regions can be isolated from H. pylori by PCR

amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               22;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         107

This sequence is a H. pylori protein of unspecified function.

The protein may be used in a vaccine to prevent or treat H. pylori
The protein may be used in a vaccine to prevent or treat H. pylori
The protein or to identify H. pylori life cycle activators or inhibitors. The
Useful as potential H. pylori life cycle activators or inhibitors. The
CDNA and probes derived from it may be used for the identification of
The pylori in a sample and the diagnosis of H. pylori infection. Nucleic
CDNA and probes complementary to the DNA act as antisense sequences and
CDNA act as antisense sequences and
CDNA action can be used in immunoassays to evaluate the abundance
CDNA addistribution of H. pylori-specific antigens. The genomic sequence of
CNATC 55679) was determined from overlapping contigs generated
CNATC 56791 was determined from overlapping contigs generated
CNATC 56791 was determined from overlapping contigs generated
CNATC 56791 was determined from overlapping regions
CNATC for ORF of at least 180 nucleotides, and the predicted coding regions
CNATC for CNATC evaluation. To identify likely H. pylori antigens for
CNATC for CNATC and a sequences predicted from various ORF

DETCHINGUES OF CROSS-LINKED

- FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED

- PERTIDGCLYCAN FROM THE LIPID INTERMEDIATES. THE ENZYME HAS A

PENICILLIN-INSENSITYE TRANSCLYCOSYLASE N-TERMINAL DOMAIN

(FORMATION OF LINEAR GIYCAN STRANDS) AND A PENICILLIN-SENSITYE

TRANSPEPTIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE

SUBUNITS) (BY SIMILARITY).

- SUBCELLUAR LOCATION: TYPE II MEMBRANE PROTEIN, PROBABLY FOUND ALL

OVER THE WHOLE CELL AT LOW CONCENTRATIONS. ALSO LOCALIZES TO THE

DIVISION SITE IN VECETATIVE CELLS.

- DEVELOPMENTAL STAGE: EXPRESSION IS CONSTANT DURING GROWTH,

DEVELORMENTAL STAGE: EXPRESSION IS CONSTANT DURING GROWTH,

DEVELORMENTAL STAGE: EXPRESSION IS CONSTANT DURING GROWTH

INTO SPORE GERMINATION.

- I- PTM: THE PRODUCT EXPRESSED FROM THE TRANSLATION OF THE PONA GENE

APPEARS AS TWO BANDS ON A GEL (1A AND 1B), BUT THE SPECIFIC AMINO

ACID SEQUENCE OF EACH PROTEIN IS UNKNOWN.

- I- PTM: THE N-TERMINUS IS BLOCKED.

- I- TIS INVOLVED IN SEPTUM SYNTHESIS; INCREASED LEVELS

OF MG2+ OR CA2+ FOR GROWTH AND GERMINATION. DEPECTS.

- I- STANDARD STATIALLY ELIMINATE THE SEPTATION DEFECTS.

- I- STANDARD STATIALLY ELIMINATE THE SEPTATION DEFECTS.

- I- STANDARD STATIALLY ELIMINATE THE SEPTATION DEFECTS.

CI- FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED
PEPTIOGGLYCAN FROM THE LIPID INTERMEDIATES. THE ENZYME HAS A
PENICILLIN-INSENSITIVE TRANSCINCOSYLASE N-TERMINAL DOMAIN
(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITIVE
(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITIVE
SUBBURITS) (BY SIMILARITY).

CI- PATHWAY: FINAL STAGES IN PEPTIDOGLYCAN SYNTHESIS.

CI- SUBCLIULAR LOCATION: Type II membrane protein. Inner membrane (By

ACYLATED BY PENICILLIN (BY SIMILARITY).
3B9C7672B86935D6 CRC64;
Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED
PEPTIDOGLYCAN FROM THE LIPID INTEREDIATES. THE ENZYME HAS A
PENICTILIN'INSENSITIVE TRANSCIPCOSYLASE N-TERMINAL DOMAIN
(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN'SENSITIVE
                                                                                               TRANSPEPTIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE SUBUNITS) (BY SIMILARITY).
PATHWAY: FINAL STAGES IN PEPTIDOGLYCAN SYNTHESIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            278 YGEDAYTOGLKVYTTVRTDHOKAATEALRKALRNFDRGSSYRGAESYIDLGRDEDAEEAV

-!- FUNCTION: CELL MALL FORMATION. SYNTHESIS OF CROSS-LINKED
PEPTIDOGLYCAN FROM THE LIPID INTERMEDIATES. THE ENZME HAS A
PENTICILLIN-INSENSITIVE TRANSGLYCOSYLASE N-TERMINAL DOMAIN
(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITIVE
TRANSPERPIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE
SUBUNITS) (BY SIMILARITY).

-!- PATHWAY: FINAL STAGES IN PEPTIDOGLYCAN SYNTHESIS.

-!- SUBCELLULAR LOCATION: Type II membrane protein. Inner membrane (

Bacteriol. 179:2783-2787(1997).

- I- FUNCTION: CELL WALL FORMATION SYNTHESIS OF CROSS-LINKED
PEPTIDOGLICACIN FROM THE LIPID INTERMEDIATES. THE ENZYME HAS A
PENTIDICLIV-INSENSITIVE TRANSCLYCOSYLASE N-TERMINAL DOMAIN
(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITIVE
TRANSPEPTIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE
SUBUNITS) (BY SIMILARITY: ESSENTAL FOR CELL WALL SYNTHESIS.

- I- PATHWAY: FINAL STAGES IN PEPTIDOGLYCAN SYNTHESIS.

- I- SUBCELLULAR LOCATION: Type II membrane protein. Inner membrane (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16-0CT-2001 (Rel. 40, Last sequence update)

Evers S., Berndt P., Lahm H.W., Wipf B., Gray C., Fountoulakis M.;

Gray C., Fountoulakis M.;

Two-dimensional map of the protecome of Haemophilus influenzae.";

Electrophoresis 21:411-429(2000).

-!- FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED PERTIDGCLYCAN FROM THE LIPID INTERMEDIATES. THE BRYZME HAS A PENICILLIN INSENSITIVE TRANSGLYCOSYLASD N-FERMINAL DOMAIN (FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITIVE TRANSPEPTIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE SUBUNITS) (BY SIMILARITY).

-!- PATHWAY: FIRAL STRAGES IN PEPTIDGGLYCAN SYNTHESIS.

-!- SUBCELLULAR LOCATION: Type II membrane protein. Inner membrane (By

-I FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED
PEPTIDOCLICACIN FROM THE LIPID INTERMEDIATES. THE ENZYME HAS A
PENIZILLIN-INSENSITIVE TRANSCLYCOSYLASE N-TERMINAL DOMAIN
(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENIZILLIN-SENSITIVE
TRANSPEPPITIDASE C.-PERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE
SUBBUNITS) (BY SINILARITY).

-I- PATHWAY: FINAL STAGES IN PEPTIDOGLYCAN SYNTHESIS.

-I- SUBCELLULAR LOCATION: Type II membrane protein. Inner membrane (By
